Erwin Schroedinger Institute, Vienna, Austria, February 2010

What is this talk about?

- Irreducible representations of $S_n \simeq$ partitions $\lambda \vdash n$.
- We are interested in normalized character values:

$$\chi^\lambda(\sigma) = \frac{\text{tr}(\rho^\lambda(\sigma))}{\dim(V_\lambda)}.$$

What is this talk about?

- Irreducible representations of $S_n \simeq$ partitions $\lambda \vdash n$.
- We are interested in normalized character values:

$$\chi^\lambda(\sigma) = \frac{\text{tr}(\rho^\lambda(\sigma))}{\dim(V_\lambda)}.$$

- Link with free probability (Biane, 1998):

$$\chi^\lambda((1 \ 2 \ \dots \ k)) \sim_{|\lambda| \rightarrow \infty} R_{k+1}(\mu_\lambda).$$

$R_{k+1}(\mu_\lambda)$ is the free cumulant of some measure μ_λ canonically associated to the diagram.

$R_{k+1}(\mu_\lambda)$ is the free cumulant of some measure μ_λ canonically associated to the diagram.

- These objects live in a combinatorial Hopf algebra.

Outline of the talk

- 1 A combinatorial Hopf algebra
 - Bipartite graphs
 - Relations
 - Polynomial realization
- 2 Characters of symmetric group and free cumulants
 - Definitions
 - Combinatorial formulas
 - Application to Kerov's polynomials

The ground set of combinatorial objects

We consider:

- unlabelled undirected bipartite graphs,
- without multiple edges,
- without isolated black vertices.

A Hopf algebra structure

We define \mathcal{H} as:

- the space of finite linear combination of graphs;
- the product is defined on the basis by the disjoint union:

$$G \cdot G' = G \sqcup G'$$

- the coproduct is given by:

$$\Delta(G) = \sum_{E \subset V_0(G)} G_E \otimes (G \setminus G_E),$$

where G_E is the induced graph on the vertices in E and their neighbours.

With some appropriate antipode, \mathcal{H} is a Hopf algebra.

Example of coproduct

$$\Delta \left(\begin{array}{c} \circ \\ \bullet \quad \circ \quad \bullet \\ \circ \\ \bullet \quad \circ \quad \bullet \\ \circ \end{array} \right) =$$

Example of coproduct

$$\Delta \left(\begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \right) =$$

Example of coproduct

$$\Delta \left(\begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \right) = 1 \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \\ \bullet \quad \bullet \\ \bullet \end{array}$$

The diagram shows the coproduct of a graph with 6 vertices (one red, one blue, one green, and three black) and 7 edges. The graph is a cycle of length 6 with an additional vertex connected to two vertices on the cycle. The coproduct is the identity element (1) tensored with the same graph.

Example of coproduct

$$\Delta \left(\begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \quad / \quad \backslash \\ \bullet \quad \bullet \quad \bullet \\ | \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} \right) = 1 \otimes \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \quad / \quad \backslash \\ \bullet \quad \bullet \quad \bullet \\ | \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} + \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} + \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} + \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} + \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ / \quad \backslash \\ \bullet \quad \bullet \\ | \\ \bullet \end{array}$$

Example of coproduct

$$\begin{aligned}
 \Delta \left(\begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \right) &= 1 \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \\
 + & \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \\
 + & \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \\
 + & \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \\
 + & \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \\
 + & \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \bullet \quad \bullet \\ \bullet \end{array}
 \end{aligned}$$

The diagram illustrates the coproduct Δ of a bipartite graph. The graph is a diamond shape with 5 vertices: a red vertex at the top, a blue vertex in the middle, and a green vertex at the bottom. The edges connect the red vertex to the two black vertices above the blue vertex, the blue vertex to the two black vertices below it, and the two black vertices above the blue vertex to the green vertex. The coproduct is shown as a sum of 10 terms, each representing a tensor product of two smaller bipartite graphs. The first term is $1 \otimes$ the original graph. The other 9 terms are tensor products of smaller bipartite graphs, with some vertices highlighted in red, blue, or green to indicate their origin in the original graph.

Example of coproduct

$$\Delta \left(\begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \end{array} \right) = 1 \otimes \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \end{array}$$

$$+ \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array}$$

$$+ \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array}$$

$$+ \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array}$$

$$+ \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} + \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \otimes \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array}$$

$$+ \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \otimes 1$$

Annihilator elements

Consider a bipartite graph G endowed with an oriented cycle C .

We define the following element of \mathcal{H}

$$\mathcal{A}_{G,C} = \sum_{E \subseteq E_{\rightarrow \bullet}(C)} (-1)^{|E|} G \setminus E$$

Example :

Quotient Hopf algebra

Let

$$\mathcal{I} := \text{Vect}(\mathcal{A}_{G,C})$$

Lemma

- \mathcal{I} is an ideal of the algebra \mathcal{H} .
- $\Delta(\mathcal{I}) \subseteq \mathcal{I} \otimes \mathcal{H} + \mathcal{H} \otimes \mathcal{I}$.

Hence \mathcal{H}/\mathcal{I} is a Hopf algebra.

A generating family

Definition

Let $I = (i_1, i_2, \dots, i_r)$ be a composition. Define G_I as the following bipartite graph:

$i_1 - 1$ black
vertices

$i_2 - 1$ black
vertices

$i_r - 1$ black
vertices

A generating family

Definition

Let $I = (i_1, i_2, \dots, i_r)$ be a composition. Define G_I as the following bipartite graph:

A generating family

Definition

Let $I = (i_1, i_2, \dots, i_r)$ be a composition. Define G_I as the following bipartite graph:

Proposition

$\{G_I, I \text{ composition}\}$ is a linear generating set of \mathcal{H}/\mathcal{I} .

Idea of proof

Proposition

$\{G_I, I \text{ composition}\}$ is a linear generating set of \mathcal{H}/\mathcal{I} .

graph G_I

Idea of proof

Proposition

$\{G_I, I \text{ composition}\}$ is a linear generating set of \mathcal{H}/\mathcal{I} .

Consider a graph $G \neq G_I$

Idea of proof

Proposition

$\{G_I, I \text{ composition}\}$ is a linear generating set of \mathcal{H}/\mathcal{I} .

There is a graph G_0 with an oriented cycle C such that

$$G_0 \setminus E_{\rightarrow}(C) = G$$

Idea of proof

Proposition

$\{G_I, I \text{ composition}\}$ is a linear generating set of \mathcal{H}/\mathcal{I} .

Consider a graph $G \neq G_I$.

Lemma: There is a graph G_0 with an oriented cycle C such that:

$$G_0 \setminus E_{\rightarrow}(C) = G$$

Consequence : in \mathcal{H}/\mathcal{I} , $G =$ linear combination of bigger graphs.

→ we iterate until we obtain a linear combination of G_I 's.

Polynomials associated to graphs

Let $\mathbf{p} = (p_1, p_2, \dots)$ and $\mathbf{q} = (q_1, q_2, \dots)$ two set (infinite) sets of variables.

Let G be a bipartite graph.

$$M_G(\mathbf{p}, \mathbf{q}) = \sum_{\varphi: V_o(G) \rightarrow \mathbb{N}^*} \prod_{o \in V_o} p_{\varphi(o)} \prod_{\bullet \in V_\bullet} q_{\psi(\bullet)},$$

where $\psi(\bullet) = \max_{\substack{o \text{ neighbour} \\ \text{of } \bullet}} \varphi(o)$.

Example:

$$M \begin{array}{c} \circ \\ / \quad \backslash \\ \bullet \quad \bullet \\ \quad \backslash / \\ \quad \quad \circ \end{array} = \sum_{i, j \geq 1} p_i p_j q_i q_{\max(i, j)}.$$

Identification of the two algebras

Lemma

- $M_{G \sqcup G'} = M_G \cdot M_{G'}$.
- $M_{A_{G,C}} = 0$.

The algebra $\text{Vect}(M_G)$ is a quotient of \mathcal{H}/\mathcal{I} .

Identification of the two algebras

Lemma

- $M_{G \sqcup G'} = M_G \cdot M_{G'}$.
- $M_{A_{G,C}} = 0$.

The algebra $\text{Vect}(M_G)$ is a quotient of \mathcal{H}/\mathcal{I} .

Lemma

The M_{G_l} , where l runs over all compositions are linearly independent.

Hence, $\text{Vect}(M_G) \simeq \mathcal{H}/\mathcal{I}$ and the G_l 's form a basis.

Identification of the two algebras

Lemma

- $M_{G \sqcup G'} = M_G \cdot M_{G'}$.
- $M_{A_{G,C}} = 0$.

The algebra $\text{Vect}(M_G)$ is a quotient of \mathcal{H}/\mathcal{I} .

Lemma

The M_{G_l} , where l runs over all compositions are linearly independent.

Hence, $\text{Vect}(M_G) \simeq \mathcal{H}/\mathcal{I}$ and the G_l 's form a basis.

Remark

It is also isomorphic to the quasi-symmetric function ring.

Sketch of proof

Lemma

The M_{G_I} , where I runs over all compositions are linearly independent.

Consider $M_{G_I}(p_1, p_2, \dots, p_r, q_1, q_2, \dots, q_r)$

(we truncate the alphabets to $r = \ell(I) = |V_o(G_I)|$ variables)

Sketch of proof

Lemma

The M_{G_I} , where I runs over all compositions are linearly independent.

Consider $M_{G_I}(p_1, p_2, \dots, p_r, q_1, q_2, \dots, q_r)$
 (we truncate the alphabets to $r = \ell(I) = |V_o(G_I)|$ variables)

We will consider only p -square free monomials.

As total degree in p is r , they are:

$$T_J = p_1 q_1^{j_1-1} p_2 q_2^{j_2-1} \dots p_r q_r^{j_r-1},$$

where J is a composition of n (total number of vertices)

In M_{G_I} , they correspond to bijections $\varphi : V_o(G_I) \simeq \{1, \dots, r\}$.

Sketch of proof

Lemma

The M_{G_I} , where I runs over all compositions are linearly independent.

$$M_{G_I} = T_I$$

Sketch of proof

Lemma

The M_{G_I} , where I runs over all compositions are linearly independent.

$$M_{G_I} = T_I + \sum_{\substack{|J|=|I|=n, \ell(J)=\ell(I)=r \\ J \geq I}} c_{I,J} T_J \\ + \text{non-}p\text{-square-free terms}$$

\geq stands for the right-dominance order.

Interpretation of the coproduct

Let us write

$$\Delta_G = \sum_i G_1^{(i)} \otimes G_2^{(i)}.$$

Then

$$\begin{aligned} M_G(p_1, \dots, p_{h+l}, q_1, \dots, q_{h+l}) = \\ \sum_i M_{G_1^{(i)}}(p_{h+1}, \dots, p_{h+l}, q_{h+1}, \dots, q_{h+l}) \\ \cdot M_{G_2^{(i)}}(p_1, \dots, p_h, q_1, \dots, q_h) \end{aligned}$$

Representation theory of symmetric groups

A representation of S_n is a pair (ρ, V) :

- V is a finite dimensional \mathbb{C} -vector space;
- ρ is a morphism $S_n \rightarrow GL(V)$.

i.e., to each $\sigma \in S_n$, we associate a matrix $\rho(\sigma)$ (we ask that the products are compatible).

To a partition $\lambda = (\lambda_1, \lambda_2, \dots)$ of n (i.e. $\lambda_1 \geq \lambda_2 \geq \dots$ and $\sum_i \lambda_i = n$), we can associate canonically an (irreducible) representation $(\rho_\lambda, V_\lambda)$.

We are interested in characters (=the trace of the representation matrices):

$$\chi^\lambda(\sigma) = \text{Tr}(\rho_\lambda(\sigma))$$

Central characters

Fix a partition μ of k . Let us define

$$\text{Ch}_\mu : \begin{array}{l} \mathcal{Y} \rightarrow \mathbb{Q}; \\ \lambda \mapsto n(n-1)\dots(n-k+1) \frac{\chi^\lambda(\sigma)}{\dim(V_\lambda)}, \end{array}$$

where $n = |\lambda|$

and σ is a permutation in S_n of cycle type $\mu 1^{n-k}$.

Examples:

$$\text{Ch}_\mu(\lambda) = 0 \quad \text{as soon as } |\lambda| < |\mu|$$

$$\text{Ch}_{1^k}(\lambda) = n(n-1)\dots(n-k+1) \quad \text{for any } \lambda \vdash n$$

$$\text{Ch}_{(2)}(\lambda) = n(n-1)\chi^\lambda((1\ 2)) = \sum_i (\lambda_i)^2 - (\lambda'_i)^2$$

$$\text{Ch}_{\mu \cup 1}(\lambda) = (n - |\mu|) \text{Ch}_\mu(\lambda) \quad \text{for any } \lambda \vdash n$$

Partition, Young diagrams and interlacing coordinates

Consider partition $\lambda = (4, 2, 2, 1)$. We draw the corresponding Young diagram (in Russian convention).

Partition, Young diagrams and interlacing coordinates

Consider partition $\lambda = (4, 2, 2, 1)$. We draw the corresponding Young diagram (in Russian convention).

The x_i (resp. y_i) are defined as x -coordinate of inner (resp. outer) corners.

Free cumulants of the transition measure

Transition measure μ_λ :

$$\int_{\mathbb{R}} \frac{d\mu(x)}{z-x} = \frac{\prod_i z - y_i}{\prod z - x_j}$$

Free cumulants:

$$R_k(\lambda) := R_k(\mu_\lambda)$$

Interesting because:

$$\text{Ch}_{(k)}(\lambda) = R_{k+1}(\lambda) + \text{smaller degree terms in } R$$

Definition of the N_G

Let G be a bipartite graph and λ a partition :

Definition of the N_G

Let G be a bipartite graph and λ a partition :

$N_G(\lambda)$ is the number of ways to:

- associate to each edge of the graph a box of the diagram;

Definition of the N_G

Let G be a bipartite graph and λ a partition :

$N_G(\lambda)$ is the number of ways to:

- associate to each edge of the graph a box of the diagram;
- boxes corresponding to edges with the same **white** (resp. **black**) extremity must be in the same **row** (resp. **column**)

Definition of the N_G

Let G be a bipartite graph and λ a partition :

$N_G(\lambda)$ is the number of ways to:

- associate to each edge of the graph a box of the diagram;
- boxes corresponding to edges with the same **white** (resp. **black**) extremity must be in the same **row** (resp. **column**)

An interesting particular case: rectangular partition

$$N_G(\lambda) = p^{|\mathcal{V}_\circ(G)|} \cdot q^{|\mathcal{V}_\bullet(G)|}$$

Indeed, one has to choose independently:

- one row per white vertex ;
- one column per black vertex.

Stanley's coordinates

$$N_G(\lambda) = M_G(\mathbf{p}, \mathbf{q})$$

As a consequence,

$$\text{Vect}(N_G) \simeq \text{Vect}(M_G) \simeq \mathcal{H}/\mathcal{I}$$

A formula for character values and free cumulants.

Theorem (F. 2006, conjectured by Stanley)

Let $\mu \vdash k$.

$$\text{Ch}_\mu = \sum_C \pm N_{G(C)},$$

where:

- the sum runs over rooted bipartite maps with k edges and *face-length* μ_1, μ_2, \dots
- $G(C)$ is the underlying graph of C .

A formula for character values and free cumulants.

Theorem (F. 2006, conjectured by Stanley)

Let $\mu \vdash k$.

$$\text{Ch}_\mu = \sum_C \pm N_{G(C)},$$

where:

- the sum runs over rooted bipartite maps with k edges and *face-length* μ_1, μ_2, \dots
- $G(C)$ is the underlying graph of C .

Corollary (independent proof, Rattan 2006)

$$R_{k+1} = \sum_T \pm N_T,$$

where T runs over rooted plane tree with k edges.

Invariants

Theorem

There exists a family F_π of functions $\mathcal{H} \rightarrow \mathbb{C}$ indexed by partitions such that:

- $F_\pi(G)$ counts some colorings of white vertices of G with some conditions on numbers of neighbours of set of vertices.
- For any graph G with an oriented cycle C ,

$$F_\pi(\mathcal{A}_{G,C}) = 0.$$

- For any partition τ , denote $R_\tau = \coprod R_{\tau_i}$. Then,

$$F_\pi(R_\tau) = \delta_{\pi,\tau}.$$

Application

F_π is defined on \mathcal{H}/\mathcal{I} and thus on $\text{Vect}(N_G)$.

$$\begin{aligned} F_\pi(\text{Ch}_\mu) &= [R_\pi] \text{Ch}_\mu \\ &= \sum_C \pm F_\pi(C) \end{aligned}$$

\Rightarrow we have a combinatorial interpretation of the coefficients of Ch_μ written as a polynomial in R .

- Answer to a question raised by Kerov (2000).
- Already known, but it is a bit simpler than previous proofs.

Extension to Jack polynomials

χ_μ^λ can be defined by:

$$s_\lambda = \sum_{\mu} \chi_\mu^\lambda \frac{p_\mu}{z_\mu}$$

Extension to Jack polynomials

χ_μ^λ can be defined by:

$$s_\lambda = \sum_{\mu} \chi_\mu^\lambda \frac{p_\mu}{z_\mu}$$

By replacing Schur function s_λ by the Jack polynomial $J_\lambda^{(\alpha)}$, one can define a continuous deformation $\text{Ch}_\mu^{(\alpha)}$ of $\text{Ch}_\mu = \text{Ch}_\mu^{(1)}$.

Extension to Jack polynomials

χ_μ^λ can be defined by:

$$s_\lambda = \sum_{\mu} \chi_\mu^\lambda \frac{p_\mu}{z_\mu}$$

By replacing Schur function s_λ by the Jack polynomial $J_\lambda^{(\alpha)}$, one can define a continuous deformation $\text{Ch}_\mu^{(\alpha)}$ of $\text{Ch}_\mu = \text{Ch}_\mu^{(1)}$.

We know that $\text{Ch}_\mu^{(\alpha)}$ belongs to $\text{Vect}(N_G)$. **Explicit expression?**

A partial result

Case $\alpha = 2$ (zonal polynomials):

Theorem (F., Śniady 2010)

Let $\mu \vdash k$.

$$\text{Ch}_\mu^{(2)} = \sum_M \pm N_{G(M)},$$

where the sum runs over rooted bipartite maps on **locally oriented surfaces** with k edges and **face-length** μ_1, μ_2, \dots

\implies combinatorial description in terms of the R_ℓ 's.

A partial result

Case $\alpha = 2$ (zonal polynomials):

Theorem (F., Śniady 2010)

Let $\mu \vdash k$.

$$\text{Ch}_\mu^{(2)} = \sum_M \pm N_{G(M)},$$

where the sum runs over rooted bipartite maps on **locally oriented surfaces** with k edges and **face-length** μ_1, μ_2, \dots

\implies combinatorial description in terms of the R_ℓ 's.

Conjecture for general $\alpha = 1 + \beta$:

Maps are counted with a weight depending on β .
