Statistical Approach

Most calculations can be summarized by

- Choose a norm: $\|\mathbf{A}\|_{\mathsf{E}} = (\mathsf{E}\,\mathsf{tr}(\mathbf{A}^\mathsf{T}\mathbf{A}))^{1/2}$ or . . .
- Use the eigenvalue/eigenvector decomposition of $\widehat{\mathbf{P}}^f$:

$$\widehat{\mathbf{P}}^f = \Gamma \widehat{\Lambda} \Gamma^\mathsf{T}$$

 Γ contains the eigenvectors

$$\widehat{\Lambda} = (\widehat{\lambda}_{ij})$$

• Simplify the norm to an expression containing $\{\lambda_i\}$, n:

$$\|\widehat{\mathbf{P}}^f\|_{\mathsf{F}}^2 = \mathsf{E}\,\mathsf{tr}(\widehat{\mathbf{P}}^{f\mathsf{T}}\widehat{\mathbf{P}}^f) = \mathsf{E}\,\mathsf{tr}(\Gamma^\mathsf{T}\widehat{\mathbf{P}}^f\Gamma\Gamma^\mathsf{T}\widehat{\mathbf{P}}^f\Gamma) = \mathsf{E}\,\mathsf{tr}(\widehat{\Lambda}\widehat{\Lambda}) = \dots$$
